Projections de la population indienne
inscrite, 1982-1996

This publication is one of four reports on the documentation of population projections of registered Indians, 1982 to 1996. The other three reports are:

- Fertility Projections of Registered Indians, 1982 to 1996
- Mortality Projections of Registered Indians, 1982 to 1996
- Migration Projections of Registered Indians, 1982 to 1996

PREFACE

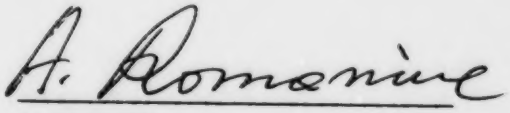
This report presents population projections of Canada's registered Indians, 1982 to 1996 for Canada, INAC regions, districts and bands. It includes a brief discussion of the methodology and assumptions, the choice of projection series and an analysis of the results, highlighting the major emerging demographic trends. These projections have been developed by a component approach, using mainly the data on population, births and deaths from the Indian Register, which provides the historical and most up-to-date demographic data on registered Indians. They are based on the estimated population by age and sex, as of December 31, 1981, adjusted for late reporting of vital events. The projection work was carried out by the Population Projections Section of the Demography Division, Statistics Canada, under contract for the Research Branch, Indian and Northern Affairs Canada.

The registered Indian population which stood at 335,000 in 1981 or 1.4% of the total population of Canada is spread very unevenly across the country. About 70% of them live on reserve and their demographic situation differs markedly from the nation's total population. Dramatic changes, however, have taken place in the demographics of the registered Indian population from the 1960s and they seem to have entered the demographic transition with a shift from a traditionally high to a moderately low fertility and a consequent slow down in growth rates. Although the current registered Indian growth rate is still relatively high, it appears that the vital rates are converging to those of Canadians as a whole with the possibility for a rapid decline in future growth rate. The projections presented here take into consideration the impact the recent demographic trends could have on the future registered Indian population.

Projections, of course, are not predictions. They are based on stated assumptions which incorporate varying degrees of uncertainty about future levels and patterns in the components of population change. Because of these uncertainties, and the limitations of the base data used, alternative projections are presented, encompassing a plausible range of variations in the factors affecting the future growth of population.

Planners, policy makers, researchers and the public at large interested in the future course of the registered Indian population at various geographic levels should find this report informative and useful.

L. Fraikin
Director, Research Branch
Indian and Northern Affairs Canada



A. Romaniuc
Director, Demography Division
Statistics Canada

ACKNOWLEDGEMENTS

The initiation and completion of this major contract project, Population Projections of Registered Indians, represent the interest, assistance and contribution of many people. The project was initiated by the Research Branch, INAC in response to departmental needs for up-to-date and accurate population projections and was undertaken by Statistics Canada on a cost recovery basis. The work was carried out by the population projection staff of the Demography Division in consultation with the Research Branch, INAC. E.T. Pryor, Director General of Census and Demographic Statistics Branch encouraged and approved its undertaking.

The planning, scheduling and direction of the project within Statistics Canada were done by M.V. George, J. Perreault and A. Romaniuc with the cooperation of K.G. Basavarajappa. Research on the evaluation and adjustment of the data used, projection model, component projections - fertility, mortality and migration - integration and analysis of projection results was carried out by a team consisting of M.V. George, M.J. Norris, L. Paquette, J. Perreault, B. Ram, A. Romaniuc and G. Rowe. A number of other people from Statistics Canada have also helped in a variety of ways. Publication review was provided by J. Dumas and N. Morin. Translation was done mainly by C. Dewer. Computer programming was done by B. Stépien of Datacap Limited and V. Kawka. Research assistance was provided by M.A. Burke, R. Costa, M.B. Ismaily, L. Dell'Oso and many others of the Division. Typing assistance was provided by D. St-Germain, F. Brown and S. Paulin.

It would have been impossible to carry out the project without the generous support and cooperation of the Research Branch, INAC. S. Klein, the project leader and G.Y. Larocque, Chief, Socio-demographic Research Section, made the arrangements for the contract, reviewed the reports produced and helped generously in the successful completion of the project. L. Fraikin, Director of Research Branch, INAC encouraged the undertaking of this project by Statistics Canada and provided the necessary support at all stages.

D.5 Projections of Registered Indian Population by Band, 1982 to 1986, 1991 and 1996 189

INTRODUCTION

This report presents projections of the registered Indian population for Canada and INAC regions by place of residence and for districts and bands. A registered Indian (hereinafter referred to as Indian) is defined as any person who is considered an Indian under the 1951 Indian Act and whose name is recorded in the Register maintained by Indian and Northern Affairs Canada (INAC). As defined by Indian and Northern Affairs Canada, "regions" coincide with provinces in all but two cases: i) the Ontario Region includes some 1,500 Indians living in the Quebec portion of the St. Regis reserve near Cornwall; ii) the Territories Region includes about 800 Indians from the Atlin and Liard River bands located in British Columbia. The Atlantic Region comprises the Indian population of New Brunswick, Nova Scotia and Prince Edward Island. The Territories Region includes Yukon and the Northwest Territories. The projections cover a 15-year period, from 1982 to 1996.

These projections should not be regarded as predictions of the size and structure of Canada's future Indian population. Rather, they represent the future trend that the population is likely to follow if the underlying assumptions on population growth, viz., fertility, mortality and migration prove correct. Since the assumptions on these components are based mainly on their historical development over the past ten years,[1] and their interrelations with the dynamics of Canada's total population growth, there should be no surprise if reality turns out to be somewhat different from the projections,

---

1. The reference period covers the ten years from 1972 to 1981. Data produced by Indian and Northern Affairs Canada before 1971 are unreliable because of weaknesses in the data editing and file updating programs. Serious coding problems were discovered for 1971.

although in all probability it would fall within the suggested range. Thus, three series of projections are offered in order to provide a range of plausible options for the future Indian population.

This report is divided into two parts. Following the presentation of a few highlights, Section 1 of Part I begins with a brief assessment of data quality. In particular, the data sources are examined with a critical eye so that subsequent analysis may be based on as complete an understanding as possible of the limitations of the data. The next three sections describe the projection algorithm and the input data; the components of population change and the projection assumptions; and the selected scenarios. Sections 5, 6 and 7 present the analysis of projection results; the limitations of projections; and a brief description of unpublished projections. In general, the focus of the analysis is on the national results, but the most significant regional disparities are also mentioned. Part II provides detailed tables of the projections. The first table presents the base population, as of December 31st, 1981. The next tables give the projected Indian population for Canada only, according to the three growth scenarios, followed by the population of regions, districts and bands, according to the medium-growth scenario.

HIGHLIGHTS

* Canada's registered Indian population would increase by 125,000 persons during the next 15 years, from 335,000 in 1981 to 456,000 by 1996, plus or minus 20,000, depending on the growth scenario considered.

* In 1981, the Indian population comprised 1.4% of the country's total population; by 1996 this proportion would probably go up to 1.7%.

* The growth rate is likely to decline in the coming years. Under the medium- and slow-growth scenarios, the rate of natural increase will fall from 2.3% per year in 1981 to 1.8% and 1.2%, respectively in year 1996; it will remain at 2.3% under the rapid-growth scenario.

* The Indian population will grow at a more rapid pace than the total population of Canada - two to three times faster if, as projected by Statistics Canada, the overall national growth rate drops to 0.5% per annum by 1996.

* Of the projected 456,000 Indians in 1996, some 320,000 will live on reserve, and about 136,000 off reserve, assuming the present distributions of 70% on reserve and 30% off reserve remain essentially unchanged.

* The number of young people (aged 0-17) is expected to increase to some 181,000 in 1996, compared with an estimated 158,000 in 1981.

* The number of preschool-age children (between 0 and 4 years of age) could rise, from 45,000 at present to 52,000 by 1996 under the medium-growth assumption. If fertility were to drop sharply, the population of this group would be less than 42,000 in 1996.

* The number of children between 5 and 13 - the elementary school age population - would expand to 92,000 by 1996 under the medium-growth assumption, an increase of 14,000 from the estimated 1981 population of 78,000.

* A slight increase from 34,000 in 1981 to 37,000 in 1996 is expected in the number of young people (14-17).

* The youth (18-24), could grow by 13%, from 53,000 in 1981 to 60,000 by 1996.

* The working age population (18-64), is expected to increase roughly to 257,000 in 1996, compared with 164,000 in 1981, or almost by 100,000, a staggering growth rate of 57%.

* In 1981, there were approximately 14,000 Indians aged 65 and over. By 1996, the population of this group may stand at 18,000, an increase of 4,000 (29%).

* The percentage of 65 and over people in the registered Indian population remains unchanged at about 4% throughout the projection period. By contrast, the 65 and over group of the country's total population would be nearly 13% in 1996.

* Dependency ratios may diminish from 136 in 1971 to 78 in 1996. The labour force would have a lighter burden, primarily because of the decrease in the demographic weight of young people.

* The median age could rise over the projection period, from 19 years in 1981 to 24 years by 1996.

* Regional distribution shows that in 1996, some 100,000 Indians could be living in Ontario. Saskatchewan could advance its rank from third in 1981 to second, with 78,000 Indians, followed by British Columbia with 76,000 Indians.

* In 1996, Ontario would still have the largest proportion of the Indian population (22%).

* Yukon and Northwest Territories Regions would continue to have the highest percentage of Indians in their population (22% in 1996 as opposed to 17% in 1981). Saskatchewan would have the second highest percentage, 7% in 1996.

* The aging process is not occurring at the same pace in all regions. Saskatchewan may continue to have the lowest median age, 16 years in 1981 and 20 years in 1996. Quebec exhibits the oldest age structure, and the median age is expected to be 27 years in 1996.

* The Indian population is spread very unevenly among the 47 districts. In 1996, the most populated district, located in Manitoba, may contain some 60,000 Indians, 13% of the whole registered Indian population of Canada.

* In 1996, 17 bands are expected to have populations of over 3,000, compared with only 8 in 1981.

PART I. DATA BASE, PROJECTION METHODOLOGY AND RESULTS

1. EVALUATION AND ADJUSTMENT OF REGISTER DATA

1.1 The Indian Register and the Data Quality

Most of the data on which the analysis and projections are based were taken from the Indian Register maintained by Indian and Northern Affairs Canada. The Register is similar to a continuous registration system for collecting demographic statistics and provides the flow data on the Indian population and the various demographic events (births, deaths, marriages, etc.). The family is the reference unit for recording the events.

The Register was established for administrative rather than statistical purposes, so the data are subject to lengthy reporting delays. For example, many births are reported and registered only several years after the fact. An event cannot be registered unless the district office receives a copy of the vital records certificate and every event has to be supported by an official document confirming that it took place. The data, therefore, require adjustment for late reporting of events. The following section deals with the complex data adjustment process for late reporting.

The data are subject to other types of errors, such as underreporting, coding and editing errors. Of these, the most obvious is caused by possible underreporting which shows up when the register data are compared with other data sources.[2]

---

2. The comparison was made with census data and data provided by the Medical Services Branch, Health and Welfare Canada.

1.2 The Problem of Late Reporting

The problem of late reporting is a quite serious one as it affects the quality of the data obtained from the Register.[3] There are long delays in reporting births (sometimes 11 years), and reporting of deaths also shows delays. Since births and deaths are classified by year of registration and year of occurrence, it is possible to get some idea of the length of reporting delays. Table 1.1 shows the inconsistencies in population data resulting from the late reporting of births. In a closed population, where births and deaths are the only factors of population change, the number of survivors of birth cohorts should not exceed the initial number. Yet the data show that the number of survivors at age one is much larger than the initial number under age one in the previous year.

Table 1.1. Late Reporting of Births and Its Impact on Registered Indian Child Population, Canada, 1965 to 1981

Year	Population under age one (on December 31st of year t)	Population aged one year (on December 31st of year t + 1)	Increase over the previous cohort
1965	7,482	8,382	900
1966	7,189	8,188	999
1967	7,041	8,080	1,039
1968	7,017	8,160	1,143
1969	6,719	7,942	1,223
1970	6,511	7,993	1,482
1971	6,171	7,777	1,606
1972	6,025	7,660	1,635
1973	5,437	7,296	1,859
1974	5,062	7,268	2,206
1975	4,756	6,976	2,220
1976	4,613	6,913	2,300
1977	5,211	7,033	1,822
1978	5,305	7,305	2,000
1979	5,156	7,152	1,996
1980	5,172	7,215	2,043
1981	5,013	7,512	2,499

Source: Registered Indian population by age, sex and place of residence, Canada, 1965-1981, Indian and Northern Affairs Canada.

3. This point was made in previous studies: A. Romaniuk, 1974; V. Piché and M.V. George, 1973; A.J. Siggner and G. Brûlotte, 1974; and F. Bernèche, 1974.

1.3 Adjustment of Data for Late Reporting

In the adjustment of the data, two cases can be identified:

1. **The event is registered:** This provides the year of occurrence and the year of registration of the event. In this case, no special estimation method is required to adjust the data. The event can simply be reallocated to its cohort by computer.

2. **The event is not yet registered:** In this case, what is required is to estimate the number of events which have probably occurred and to distribute them according to their presumed year of occurence. For example, if late reporting extends as far as 11 years, the reporting of births which occurred between 1972 and 1981 will not be considered complete until 1992. It is therefore necessary to estimate the number of "missing births", the births which occurred during the last 11 year period but will be reported sometime between 1981 and 1992.

1.4 Method of Estimation

The estimation of "missing" events, those that have occurred but have not yet been reported, is based on an analysis of late reporting patterns made possible by the cross-classification of events by year of occurrence and year of registration. The basic approach used in dealing with late reporting is essentially a trend analysis - that is, an extrapolation of past trends in late reporting. This proved to be a complex undertaking because the propensity to late reporting not only increased over the years but also varied widely from province to province. Furthermore, the very small number of events in some cases hampered the analysis and made it difficult to gauge the effect of random fluctuations. Nonetheless, an extrapolation assumption was arrived at on the basis of the results of a regression analysis (see George, Paquette and Perreault, 1984).

Once the late reported births have been assigned to their year of occurrence and missing births have been estimated, the cohorts must be "aged" through successive years. In other words, the birth cohort of year t becomes the population of age 1 in year t + 1, the population of age 2 the following year, and so on. These births and population counts are then added to the corresponding numbers in the Indian Register data for the appropriate ages. A similar adjustment is made for deaths except that the number of deceased individuals at each age is subtracted from the corresponding numbers in the Register data.

1.5 Evaluation of the Adjustment

The primary objective for adjusting the data was to obtain as realistic a base population as possible for the projection and to establish reasonably accurate mortality and fertility rates on which to base the component assumptions. The results of the adjustment are given in Table 1.2.

Table 1.2 Registered Indian Population Unadjusted and Adjusted for Late Reporting of Births and Deaths, Canada, 1981

Age	Unadjusted	Adjusted	Difference
0	5,013	9,586	4,573
1	7,215	9,262	2,047
2	7,589	8,957	1,368
3	7,929	8,947	1,018
4	7,894	8,725	831
5	7,884	8,551	667
6	8,075	8,633	558
7	8,177	8,644	467
8	8,136	8,508	372
9	8,471	8,777	306
10-14	43,015	43,258	243
15-24	78,397	78,272	-125
25-34	48,764	48,650	-114
35-44	29,803	29,717	-86
45-54	19,851	19,782	-69
55-64	13,057	12,970	-87
65+	14,512	14,236	-276
Total	323,782	335,475	11,693

Source: Data from the Indian Register (INAC), adjusted for the late reporting of births and deaths.

The table shows that for 1981, the adjusted population of the 0-14 age group was roughly 12,500 higher than the population recorded in the Register; much of this increase was due to the adjustment of birth data for 1972 through 1981. The adjustment had a greater impact on the population of younger age groups. Its effect on the adult population was far less significant, as only a small number of deceased (and presumed deceased) persons were deleted from the Register data. After adjustment, the total population of registered Indians for 1981 was over 335,000, compared with 324,000 in the Register, a difference of 3.6%.

2. PROJECTION MODEL AND ALGORITHM

There is a wide variety of projection models. After assessing the appropriateness of several, a composite model, which combines the cohort-component method and the ratio method was selected. The conceptual approach is thus twofold. At the national and regional level, the projection is based on the component method in which natural increase and migration are explicitly taken into account. The ratio method is used in a second step, to disaggregate the projected populations at the sub-regional levels (residence, districts and bands). Each of these is described below.

2.1 Regional Component Method

In essence, this method involves separate analysis and projection of each component of population change (mortality, fertility and migration) based on an analysis of past trends. A set of assumed rates or ratios representing each component is applied to the population by age and sex of an initial year in order to obtain the projected population for the following year. The base population used here is the estimated Indian population, by single years of age and sex, for the regions, as of December 31, 1981. This population is obtained from the Indian Register and is adjusted for late reporting of births and deaths. Projections are thus developed first for each region by age and sex. The projections at the national level are then obtained by aggregating regional figures.

2.2 The Ratio Method

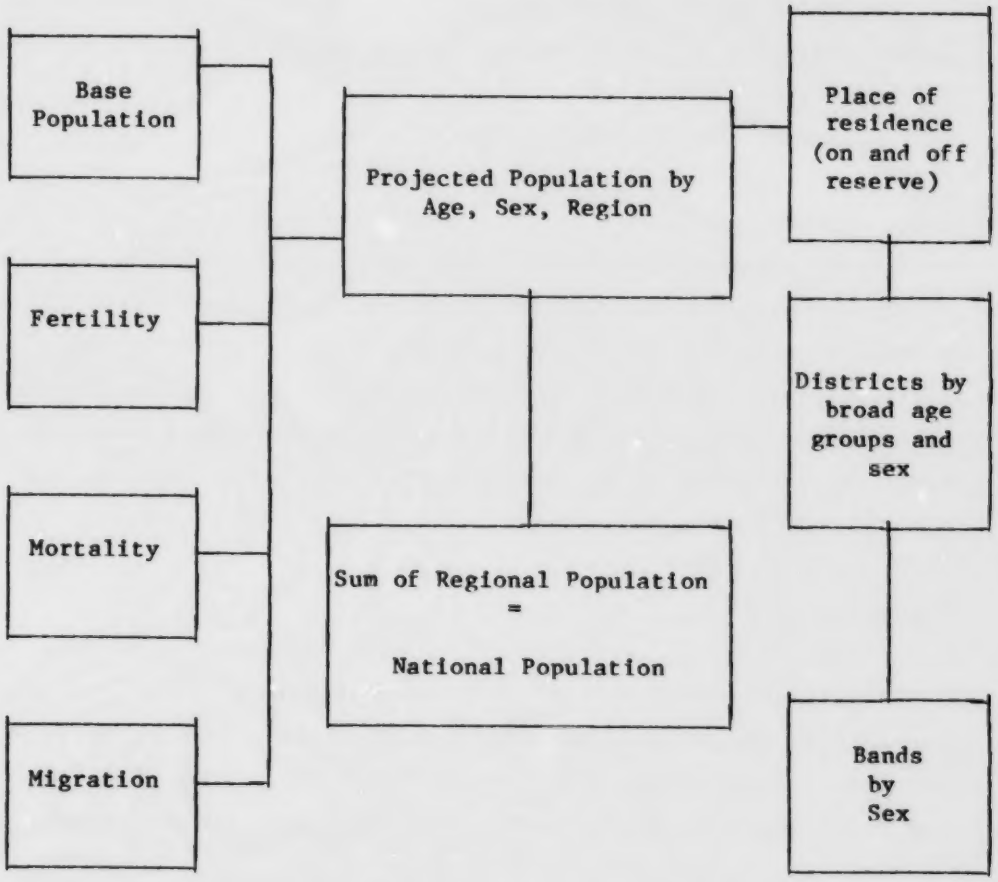
The ratio method essentially involves projecting the proportion or ratio which a given area constitutes of some larger area and applying this proportion to an independently derived projected population for the larger area. It is noted for its simplicity and effectiveness when the populations involved are fairly small. It was employed to disaggregate the projected population for INAC regions by place of residence (on and off reserve) and by district and band. There are three steps:

i) First, the projected regional population by sex and age groups is broken down by place of residence (on and off reserve).

ii) Second, the regional population projection by residence as obtained in Step 1 is distributed by district.

iii) Third, the projected population by district in Step 2 is distributed by band (see Flow Chart).

Chart 2.1 Flow Chart of the Projection Model



Phase 1. Regional/National Projection
Phase 2. Disaggregation by place of residence, district and band
Base Population
Fertility
Mortality
Migration
Projected Population by Age, Sex, Region
Sum of Regional Population = National Population
Place of residence (on and off reserve)
Districts by broad age groups and sex
Bands by Sex

2.3 Input Specifications

The input data are as follows:

Phase 1

Base Population

Population by sex and age (0, 1, 2, ..., 64, 65 and over) from the Indian Register, adjusted for late reporting of births and deaths, as of December 31, 1981.

Fertility

A three parameter model developed by A. Romaniuk (1975, pp. 39-54) is applied to project the total number of births required for the component approach. In this model, the projected age-specific fertility rates, which are applied to project births, are derived from three simple parameters, namely, total fertility rate, mean and modal ages of fertility. The distribution of births by sex is done according to an assumed ratio.

Mortality

To estimate the number of survivors, the parameters used are the survival ratios by sex and single years of age, from birth to age 65 and over. These values were computed for 1981, 1986, 1991 and 1996, and values for intervening years were derived by interpolation.

Migration

Interregional migration was projected using the following parameters:

(a) the annual out-migration rate for each province of origin;

(b) the percentage distribution of migrants by province of destination for each place of origin; and

(c) age-sex specific migration rates.

Phase 2

Three different series of proportions were calculated:

1. the proportions of the on- and off-reserve populations by sex and age groups for each INAC region;

2. the proportions of each district populations by age groups and sex in the regional populations, according to place of residence; and

3. the proportions of the population of each band by sex and place of residence in the population of the corresponding district.

By inputting the above data to the projection model using the two-phase procedure described above, the projections of the registered Indian population were obtained. Total population, by sex and place of residence is available at the national, regional, district and band levels. Data by age groups are available for Canada, INAC regions and districts only.

3. TRENDS AND PROJECTIONS OF EACH COMPONENT: FERTILITY, MORTALITY AND MIGRATION

3.1 Fertility

As available data were not adequate to permit a detailed analysis of the fertility behavior of Indian women, the trend analysis was limited to the three following parameters: the total fertility rate, i.e., the number of births per woman, the mean and modal ages of fertility.[4]

The trends in these indices for the Indian population were examined and compared with the trends for the Canadian population as a whole. The analysis revealed that the fertility levels of the Indian population and the total population were converging (i.e., the gap between the two has been narrowing over time). It was decided, therefore, to proceed on the assumption that this trend would continue. The next step was to determine the "catch-up rate" - that is to define a period over which the Indian fertility would reach the overall Canadian level. In 1971 for example, there was a difference of 3 children per woman between the two populations; by 1981, this gap was reduced by half, to 1.5 children. The fertility of the Indian population in 1981 was at the same level as the fertility of the entire Canadian population in 1965 (3.2 children per woman), hence a time lag of 16 years.

---

4. For more details concerning the definitions, the method and assumptions, see background paper, B. Ram and A. Romaniuc, Fertility Projections of Registered Indians, 1982 to 1996, Research Branch, INAC, 1985.

On the basis of the analysis of fertility, three assumptions were formulated (Figure 3.1 and Table 3.1):

1. **A slow decline in fertility** : The convergence of the fertility levels of Indians and the total population continues at a very slow pace, over 50 years. This represents a decrease in fertility of about 0.6 children per woman by 1996 (from 3.2 to 2.6).

2. **A rapid decline in fertility** : The Indian fertility "catches up" with national fertility over a period of about 35 years. This represents a decrease of about 1 child per woman by 1996 (from 3.2 to 2.1).

3. **A constant fertility** : This assumes that the current fertility level remains constant for the projection period. It is a neutral assumption and also makes allowance for any possible underreporting of births suspected in the time series.

3.2 Mortality

The study of mortality was conducted on the basis of the age-specific death rates which were later converted into life table functions. Survival ratios required for the projections were derived from the life tables developed at the Canada level[5].

The comparison of the life expectancy of the Indian population with that of the overall Canadian population did not indicate the same pattern of convergence as that observed for fertility. The Indian population mortality level lags considerably behind the overall Canadian population. Life expectancy at birth, currently estimated at 62 and 69 years for Indian males and females respectively, is on a par with the levels reached some forty years ago by the overall Canadian population (Table 3.2). Could this lag in mortality between the two populations be related partly to the deficiency of the data and to fluctuations associated with the small number of deaths? A satisfactory answer to this question is difficult at this stage in the absence of further information on Indian mortality.

On the basis of the mortality analysis and hypothesis regarding expected changes, two assumptions were selected:

1. **Decreasing mortality** : In this assumption, life expectancy gains of roughly two years per five-year of the projection period were postulated. Under this assumption, life expectancy would reach 68 years for male Indians and 75 years for females by the end of the projection period. The assumed mortality level is the same as that for the total Canadian population in 1961.

---

5. For more details concerning the method and assumptions, see the background paper, G. Rowe and M.J. Norris, Mortality Projections of Registered Indians, 1982 to 1996, Research Branch, INAC, 1985.

2. **Constant mortality** : This assumption of a constant mortality level is offered partly to allow for the possibility of an underreporting of deaths suspected in the time series. Since mortality levels generally decrease over time, a constant level represents a high assumption compared to the decreasing mortality assumption.

Table 3.2 Estimated and Projected Life Expectancy at Birth, Registered Indian and Total Populations of Canada, 1976 to 1996

Year	Life Expectancy at birth			
	Male		Female

Rowe and M.J. Norris, Mortality Projections of Registered Indians, 1982 to 1996, Research Branch, INAC, 1985 and Statistics Canada, Catalogue No. 91-520, 1985, for total population.

3.3 Migration

Migration is generally broken down into international and internal migration. For projection purposes, it is assumed that the Indian population is not affected by international migration[6]. Consequently, the analysis and projections take only interregional movements into account.

Interregional[7] migration data for the Indian population were derived from responses to the 1981 Census question "Where did you live five years ago?". This question and the one on ethnic origin were generally asked to one in every five Indian households. Thus, the census data provide information on migrations that occurred within a five-year interval and the only such interval for which data are available for registered or "status" Indians is 1976-1981. The fact that the reference period is so short severely restricts the type of analysis that can be carried out. However limited, the analysis has revealed certain characteristics of the pattern of interprovincial migration by Indians for the 1976-1981 period and these were compared with the pattern observed for the Canadian population as a whole.

On a national basis, the 1976-1981 period was marked by a heavy migration flow of Canadians to western Canada, especially to Alberta (Statistics Canada, Catalogue 91-520, 1985). The analysis here shows a similar, though less pronounced pattern for the Indian population. For most of the regions, interregional migration had a negligible effect on the growth of the Indian population. The only exception was

---

6. Movements of Indians across the Canadian-American border in either direction do not require a passport; such movements are not considered international migration and are not recorded in the Register.

7. Data on internal migration movements were calculated by province and aggregates of provinces for the Atlantic and Northwest Territories and Yukon.

Alberta, where growth due to migration equalled approximately 30% of natural increase between 1976 and 1981.

In light of the above analysis, it was decided to link the future trend in Indian migration to the overall Canadian pattern based on assumptions recently developed for Statistics Canada projections. (Statistics Canada, Catalogue 91-520, 1985). Of the three internal migration assumptions developed for the projection of the Canadian population, the scenario that represents a continuation of recent trends was selected as the most likely in the near future.

Table 3.3 contains migration data from the 1981 Census and assumed migration levels for the next fifteen years.[8]

Table 3.3 Interregional Migration of Registered Indian Population of Canada, 1977 to 1996

Region	Estimated migration[1] 1977-81			Assumed levels of net migration[2]		
	In-migration	Out-migration	Net migration	1982-86	1987-91	1992-96

8. For more details concerning the method and assumptions, see the background paper, M.J. Norris, Migration Projections of Registered Indians, 1982 to 1996, Research Branch, INAC, 1985.

4. CHOICE OF PROJECTION SCENARIOS

Combining the three fertility assumptions with the two mortality assumptions and the single migration assumption yields a total of six projections. Of these six, three projections were selected that provide a plausible range of growth options for the Indian population over the next ten to fifteen years. These scenarios encompass three types of growth: slow, medium and rapid.

1. **The slow-growth scenario (Projection 4)**

   In this scenario, a continuing high mortality (constant assumption) is combined with a fairly rapid decline in fertility. Here, because of a larger number of deaths than in the other two scenarios and a smaller number of births, the Indian population grows more slowly.

2. **The medium-growth scenario (Projection 3)**

   In this scenario, mortality decreases at a moderate pace, while fertility declines slowly. This is a middle series, and the projected population according to this will fall between the slow-growth and rapid-growth series.

3. **The rapid-growth scenario (Projection 6)**

   In this scenario, mortality decreases at a moderate pace and fertility is maintained at the level estimated for 1981 throughout the projection period (constant level). As a result, the population grows at a fairly rapid pace.

Table 4.1 presents the six possible projections as well as the expected total population for each, at the end of the projected period.

Table 4.1 Scenarios Generated by the Combination of the Fertility, Mortality and Migration Assumptions and Expected Populations in 1996

Projection	Assumptions			Population Expected by 1996 (in thousands)
	Fertility (number of children per woman by 1996)		Mortality	
(1)	constant	(3.2)	constant	471
(2)	slow decline	(2.6)	constant	450
(3) *	slow decline	(2.6)	declining	456
(4) *	rapid decline	(2.1)	constant	433
(5)	rapid decline	(2.1)	declining	439
(6) *	constant	(3.2)	declining	477

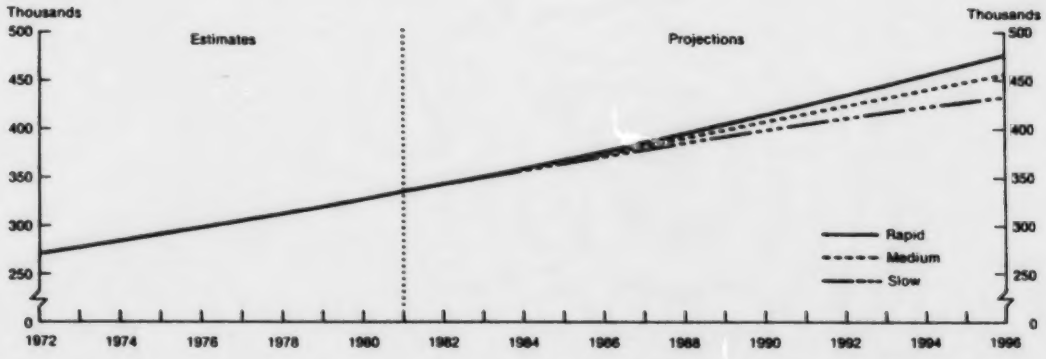
Note: The projections with an asterisk represent the medium-, slow- and rapid-growth scenarios, respectively. Projection 1 is built upon a zero migration assumption.

5. PROJECTION RESULTS

5.1 Demographic Trends in Canada's Registered Indian Population

Canada's registered Indian population grew substantially during the last decade. The number of Indians stood at 335,000 in 1981, compared with 263,000 in 1971 (Figure 5.1). This is an increase of about 72,000, or 27%, in ten years. By comparison, Canada's total population rose by only 13% over the same period. Hence, the Indian population's growth rate was more than twice that of the Canadian population as a whole.

Figure 5.1
Registered Indian Population, Canada, 1972-1996



Source: 1972-1981: Data from the Indian Register (INAC), adjusted for the late reporting of births and deaths; 1982-1996: Detailed tables, Part II.

If recent fertility and mortality trends continue, the Indian population will be close to the half-million mark by the turn of the century. Thus, by 1996, the final year of our projection period, the number of Indians will probably be in the neighbourhood of 456,000, with a possible range of plus or minus 20,000, depending on the growth scenario that will prevail in the future (Table 5.1).

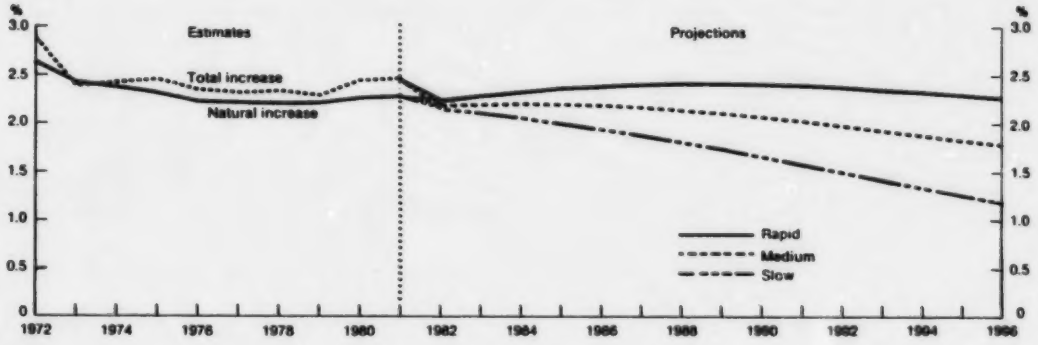
1996	476.8	456.3	432.9

Note: As of December 31st of each year.

Source: 1971-1981: Data from the Indian Register (INAC), adjusted for late reporting of births and deaths; 1982-1996: Detailed Tables, Part II.

The Indian population's growth rate, like that of the Canadian population as a whole, is expected to decline in the coming years. It will probably fall from its 1981 level of 2.3% to a level ranging from 1.2% (slow-growth) to 1.8% (medium-growth) in 1996.[9] On the other hand, if fertility remains essentially at its present level, around 3.2 children per woman, the growth rate will be as much as the 1981 growth rate of 2.3% per year (Figure 5.2).

Figure 5.2
Rates of Population Growth of Registered Indians, Canada, 1972-1996



Source: 1972-1981: Data from the Indian Register (INAC), adjusted for the late reporting of births and deaths; 1982-1996: Detailed tables, Part II.

Table 5.2 contains expected trends in the number of births, deaths and in natural increase for the Indian population under each of the three scenarios. In all the three, projected natural increase is expected to be positive; it climbs steadily in the rapid- and medium-growth scenarios (only up to 1991 in the latter), but declines in the slow-growth scenario.

---

9. Natural increase only.

The trend in natural increase, births and deaths is illustrated in Table 5.2 and in Figure 5.3.

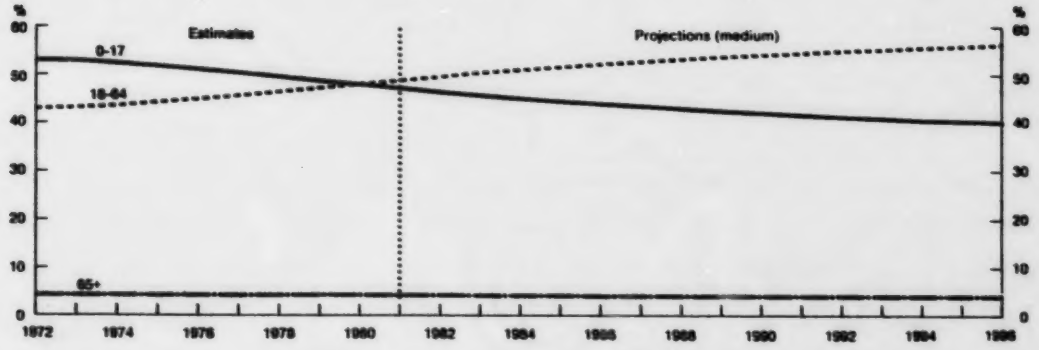
5.2 The Age Structure

The evolving age structure will depend on the growth scenario that will prevail. The preschool- and school-age populations are subject to the greatest uncertainty as they are directly affected by the future trend in fertility. On the other hand, the projected adult population for the period up to 1996 (i.e., 15 years ahead) will be subject to less error since they are already born. The following section briefly discusses the expected growth of the three broad age groups - young people (0-17), the labour force group (18 to 64) and the elderly (65 and over) as shown in Figure 5.4.

Figure 5.4
Distribution of Registered Indian Population by Broad Age Groups, Canada, 1972-1996



Source: 1972-1981: Data from the Indian Register (INAC), adjusted for the late reporting of births and deaths; 1982-1996: Detailed tables, Part II.

The Young People (Age 0-17)

In 1971, there were approximately 140,000 young Indians under 18 years of age. Ten years later, the size of the group was close to 158,000, an increase of 13%. This population will continue to grow in the future. By 1996, the number of young people would be about 181,000 in the medium-growth scenario, with a possible range of plus or minus 20,000 (Table 5.3 and Figure 5.5).

Table 5.3 The Young Registered Indian Population Aged 0-17, Canada, 1971 to 1996

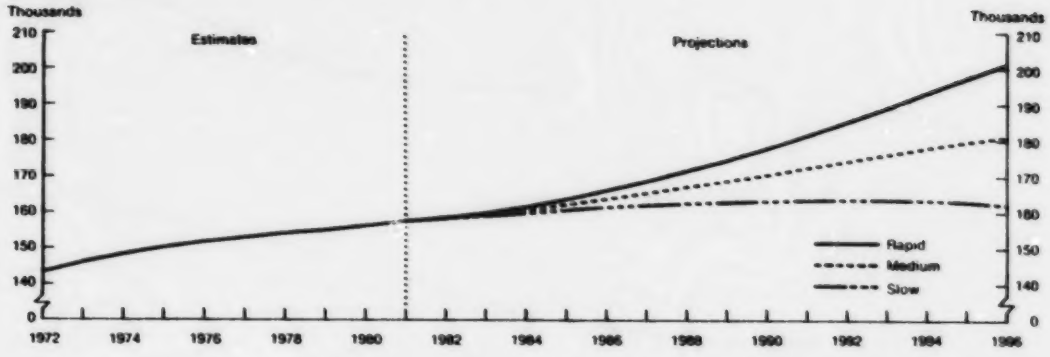
(in thousands)

Year	Estimated population		
1971	140.2		
1976	151.8		
1981	157.5		
	Projected growth scenarios		
	Rapid	**Medium**	**Slow**
1986	166.2	163.8	161.5
1991	181.6	172.5	163.5
1996	201.5	181.1	161.9

Source: Same as Table 5.1.

The margin of uncertainty in the youth population, about 40,000 in 1996 (the range between the slow- and rapid-growth scenarios), is almost solely responsible for the uncertainty in the size of the total Indian population. The size of the older groups, already born, depends only on the mortality assumptions, which have a lesser effect.

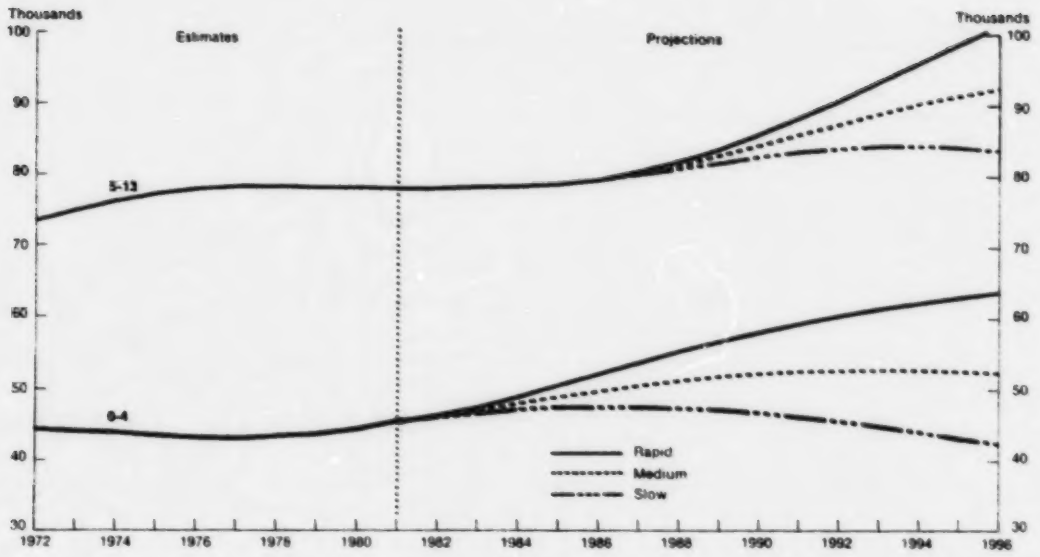
Figure 5.5
Young Population Aged 0-17, Registered Indians, Canada, 1972-1996



Source: 1972-1981 Data from the Indian Register (INAC), adjusted for the late reporting of births and deaths; 1982-1996 Detailed tables, Part II

The 0-4 Age Group : This group represents the preschool segment of the population. As shown in Figure 5.6, its number will probably continue to grow for a few years. In the rapid-growth scenario, this group increases steadily to 64,000 in 1996; in the medium-growth projection, its size increases until 1994 and then begins to decline. In the slow-growth scenario, in which fertility is assumed to decrease rapidly, this group will have a very modest growth for a few years, and then drops sharply; by 1996, it would have dropped to some 42,000, compared with 45,000 in 1981.

Figure 5.6
Children Aged 0-4 and 5-13, Registered Indians, Canada, 1972-1996

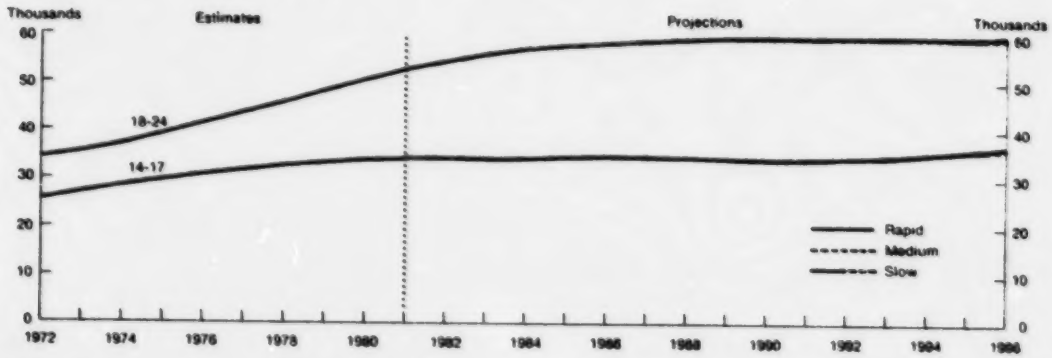


Source: 1972-1981: Data from the Indian Register (INAC), adjusted for the late reporting of births and deaths. 1982-1996: Detailed tables, Part II.

The 5-13 Age Group : The elementary-school age population will probably increase in the future, faster in the rapid-growth scenario and slower in the slow-growth scenario. Up to 1986, growth is almost the same in all three scenarios, since these children are already born. In 1987, the curves begin to diverge. In the medium-growth scenario, the population in the ages 5 to 13 would reach about 92,000 in 1996 (compared with 83,000 in the slow-growth scenario and 101,000 in the rapid-growth scenario). Under the medium-growth scenario, this represents an increase of 14,000, or 18%, from the estimated 78,000 in 1981 (Figure 5.6).

The 14-17 Age Group :A small increase is expected in the 14-17 age group, which approximates the secondary-school age population. It will probably edge up from some 34,000 in 1981 to roughly 37,000 in 1996, a gain of 7% in 15 years. There is hardly any difference between the projected figures under the three scenarios, the only variations being caused by different mortality assumptions (Figure 5.7).

Figure 5.7
Young Population Aged 14-17 and 18-24, Registered Indians, Canada, 1972-1996



Source: 1972-1981: Data from the Indian Register (INAC), adjusted for the late reporting of births and deaths; 1982-1996: Detailed tables, Part II.

The Youth (Age 18-24)

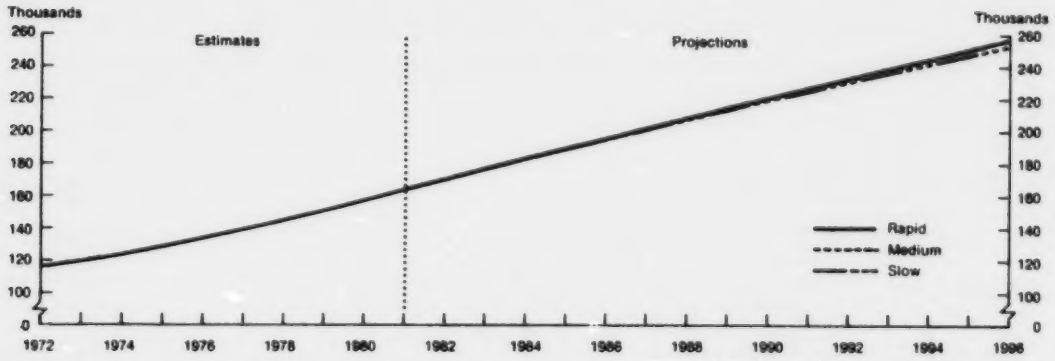
The youth represents an important sub-group of any population. It is in this age range that people enter the labour force, start families, form households, pursue post-secondary education but also suffer from

high unemployment. The number of young adults will rise over the next few years, albeit not as rapidly as in the past. It was estimated at about 53,000 in 1981 and will probably be close to 60,000 by 1996, an increase of 13% in 15 years (Figure5.7).

The Labour Force Group (Age 18-64)

Between 1971 and 1981, there was a substantial increase in the working-age Indian population, (18-64 years), from 112,000 to 164,000. On the basis of the rapid- and medium-growth projections, the size of the labour force group would be close to 257,000 by 1996. However, if mortality does not decline but remains essentially unchanged (slow-growth scenario), the size of this group will be about 253,000, i.e., 4,000 fewer only, when compared with the decreasing mortality scenario (Figure 5.8).

Figure 5.8
Labour Force Group Aged 18-64, Registered Indians, Canada, 1972-1996



Source: 1972-1981: Data from the Indian Register (INAC), adjusted for the late reporting of births and deaths; 1982-1996: Detailed tables, Part II.

There will be a steady downward trend in the dependency ratio (Table 5.4). This ratio expresses the number of people of 'dependent ages' (0-17 and 65+) per 100 persons of 'working age' (18-64). It fell from 136 in 1971 to 105 in 1981, and may continue to decline through the projection period, to 78 "dependants" per hundred people of working age in 1996 (medium-growth scenario). Thus, the dependency burden is most likely to become lighter over the next few years, primarily because of the decrease in the proportion of young people, since the dependency ratio of the elderly will ease only slightly. While the overall dependency ratio for the Indian population drops appreciably, it remains higher than that projected for the total Canadian population (close to 60) throughout the projection period.

Table 5.4 Dependency Ratios for Registered Indian and Total Populations of Canada, 1971 to 1996

Year	Indian Population			Total population
	Estimated			Census
1971	136			78

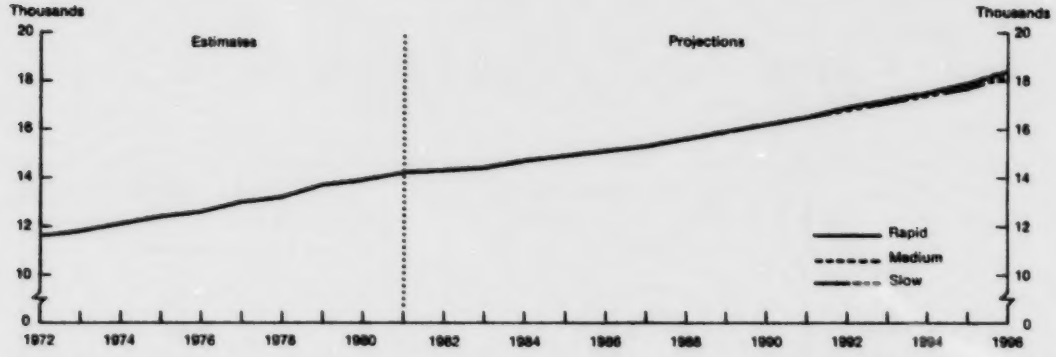
The Elderly (Age 65 and over)

The population aged 65 and over, estimated at 14,000 in 1981, will continue to grow in the coming years. By 1996, it will probably be about 18,000, an increase of 4,000 (29%). There is virtually no difference among the three scenarios in the size of this age group (Figure 5.9).

Figure 5.9
The 65 and over Population of Registered Indians, Canada, 1972-1996



Source: 1972-1981: Data from the Indian Register (INAC), adjusted for the late reporting of births and deaths; 1982-1996: Detailed tables, Part II.

The proportion of elderly people in the Indian population, which has been remarkably stable in past years, will remain almost unchanged in the future. It stood at roughly 4% in 1981, and will hold at approximately the same level through 1996. It is very low compared with the Canadian population as a whole, where it is expected to reach 13% by the turn of the century.

The increase in the median age confirms the aging trend mentioned earlier (Table 5.5). It was 17 years in 1971 and about 19 in 1981. By the turn of the century, it could reach 24 years, still far below the projected median age of 36 years for Canada as a whole (on the assumption that current trends would persist). Thus, even though the Indian population has begun its aging process, it will continue to display a much younger age pattern than the national population as a whole.

Table 5.5 Median Age of Registered Indian and Total Populations of Canada, 1971 to 1996 (in years)

5.3 Projected Indian Population On and Off Reserve[10]

A majority of Indians live on reserve, about 70% in 1981 according to Register data. Nevertheless, there is a movement away from the reserves. The off-reserve population grew from 27% in 1971 to almost 30% in 1981 (Table 5.6).

---

10. The on-reserve population includes Indians living on crown lands and settlements. The off-reserve category applies to Indians residing off reserve for twelve consecutive months.

Table 5.6 Proportion of Registered Indian Population Living On and Off Reserve, Canada, 1971 to 1981

(in per cent)

Year	On Reserve	Off Reserve	Total
1971	73.4	26.6	100.0
1972	72.6	27.4	100.0
1973	71.6	28.4	100.0
1974	73.1	26.9	100.0
1975	72.8	27.2	100.0
1976	72.7	27.3	100.0
1977	72.5	27.5	100.0

1979	70.7	29.3	100.0
1980	70.8	29.2	100.0
1981	70.4	29.6	100.0

Source: Same as Table 5.1

In the last three years however, there has been little change in the percentage of the off-reserve population. Is this a shift caused by economic conditions, with Indians choosing to stay on their reserves in periods of economic hardship, or is there reason to suspect the quality of the data? It should be noted that information on place of residence is obtained from a form sent out annually by Indian and Northern Affairs Canada and that the non-response rate is fairly high.[11] In the earlier projections for 1973-1985, by the Department, it was assumed that the proportion of Indians living off reserve might increase to 40% by 1985 (Siggner and Brûlotte, 1972). In its second series of projections 1977-1991, the proportion was revised downward to 31% in 1985 and 33% in 1991 (Siggner, 1977). According to the 1981 Census data, the proportion was between 31% and 40%, depending on how the Indian population universe was defined.

---

11. According to the Department, if a band does not respond or is late responding, the previous year's figures are used. This would partially explain the lack of change in the proportion.

In light of the foregoing information and the uncertainty about the proportions on and off reserve, it was assumed that the percentage distribution of Indians by place of residence (the three-year average 1980 to 1982) would remain virtually unchanged over the next 15 years.[12] It is possible that this assumption may lead to an over estimation of the number of Indians living on reserve at the end of the 15-year projection period, and, conversely, to an underestimation of the number of Indians who will leave their reserves during this period.

Under this assumption of unchanged distribution (70% on reserve and 30% off reserve), 320,000 of the projected 456,000 Indians in 1996 would be living on reserve and about 136,000 off reserve (Tables 5.7 and 5.8).

Table 5.7 Registered Indian Population Living On and Off Reserve, Canada, 1971 to 1996

Year	Population (in thousands)		
	On Reserve	Off Reserve	Total
1971	193.2	69.9	263.1
1981	236.1	99.3	335.5
1986	264.2	110.0	374.3

1996	320.6	135.7	456.3

Note: Calculations based on unrounded data.
Source: Same as Table 5.1.

12. A number of factors suggest that the off-reserve percentage will probably have to be revised upward in subsequent projections:
    - the growing number of interethnic marriages (more than a third of marriages and an unknown, though certainly increasing, number of common-law marriages), which almost invariably involve moving off the reserves; and
    - possible changes to the Indian Act, (1951) may increase the off-reserve Indian population; and
    - a more detailed study of non-response in the annual questionnaire on place of residence would probably confirm the suspected understatement of the off-reserve population.

Table 5.8 Registered Indian Population Living On and Off Reserve, by Broad Age Groups, Canada, 1981, 1986, 1991 and 1996 (in thousands)

Year	Age group									
	0-19		20-29		30-64		65+		Total

5.4 Regional Distribution of Indian Population[13]

The Indian population is spread very unevenly among the country's eight regions (Table 5.9). In 1981, Ontario had the largest proportion, 22% of the Indian population. It was followed by British Columbia with 18%, Saskatchewan and Manitoba with about 15% each, and Alberta with 12%. Quebec had 10%, while the Atlantic Region and the Territories had much smaller shares, roughly 4% each.

13. See Introduction for definition of regions.

Table 5.9 Distribution of Registered Indian Population of Canada by Region, 1971, 1981 and 1996 (numbers in thousands)

REGION	1971	%	1981	%	1996	%
Atlantic	10.2	3.9	13.0	3.9	17.6	3.8
Quebec	29.2	11.1	33.4	10.0	41.8	9.2
Ontario	58.3	22.1	75.6	22.5	99.2	21.7
Manitoba	37.6	14.3	49.6	14.8	70.2	15.4
Saskatchewan	38.2	14.5	51.1	15.2	78.0	17.1
Alberta	30.5	11.6	40.7	12.1	56.4	12.4
British Columbia	49.9	19.0	60.0	17.9	75.9	16.6
Territories	9.3	3.5	11.9	3.6	17.3	3.8
Canada	263.1	100.0	335.5	100.0	456.3	100.0

Note: Calculations based on unrounded data.
Source: Same as Table 5.1.

The projections show little change in this distribution, except for a slight increase in the percentages of high-fertility regions and a corresponding decline in those with lower fertility (such as Quebec, Ontario and British Columbia). In 1996, some 100,000 Indians could be residing in Ontario. Saskatchewan could rank second, with 78,000 Indians, followed by British Columbia with 76,000 (Figure 5.10).

Indian Population as a Percentage of Regional Total Populations

The percentage of the Indian population is very small in each region. In the eastern and central regions, the Indian population makes up less than 1% of the total population. The proportions are larger in western Canada. Saskatchewan has the largest concentration (5% in 1981). The Territories Region is a special case, as the Indian population accounts for some 17% of the overall population in 1981 (Table 5.10). The Indian population is expected to make 1.7% of the total population of the country by 1996.

Figure 5.10

Source: Same as Table 5.4

Distribution of Indian Population by Age for Each Region

The age structure of the population varies appreciably from region to region, as shown in Table 5.11. The aging trend is more apparent in regions where the fertility decline is more pronounced (Quebec, Ontario and British Columbia). In Quebec, for example, the proportion of young people (age 0-17) in the Indian population fell from 47% in 1971 to 40% in 1981. The proportion may reach 34% by 1996.

Table 5.11 Distribution of Registered Indian Population by Broad Age Groups, Canada and Regions, 1971, 1981 and 1996

(in per cent)

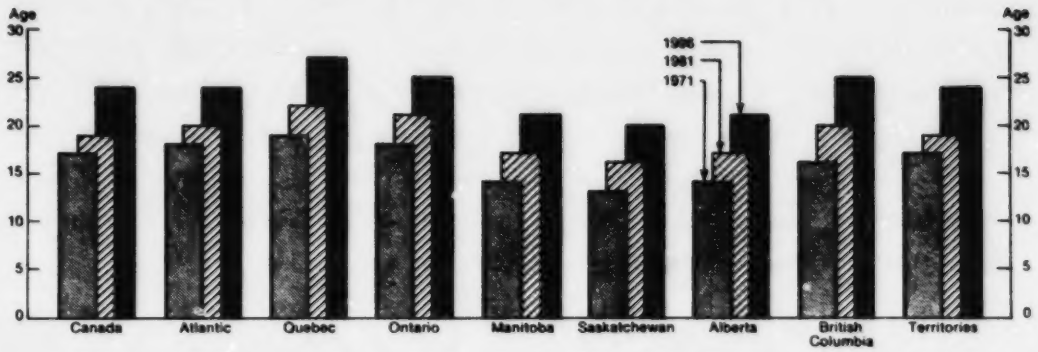
Canada	53.3	47.0	39.7	42.4	48.8	56.3	4.3	4.2	4.0

Note: Calculations based on unrounded data.
Source: Same as Table 5.1.

By contrast, there is very little change in the proportion of elderly people (65 and over) over the same period (1971-1996). It remains between 3% and 6% in all the regions.

The median age confirms that the aging process is not occurring at the same pace in all regions (Figure 5.11). Saskatchewan has the youngest age structure. Its median age was 13 years in 1971, compared with 19 years in Quebec. In 1981, Quebec had a median age of 22, and in 1996, if the declining fertility assumption proves correct, its median age could be 27 years.

Figure 5.11
Median Age of Registered Indian Population, Canada and Regions, 1971, 1981 and 1996



Source: 1971-1981: Data from the Indian Register (INAC), adjusted for the late reporting of births and deaths; 1982-1996: Detailed tables, Part II.

On the basis of the age structure, the regions can be divided into two groups, with Quebec and Saskatchewan at the two extremes. On the one hand, the eastern and central regions as well as British Columbia have age structures in which the aging process is already clearly visible. On the other, the Prairies and the Territories still have comparatively young populations.

5.5 Indian Population in Districts and Bands

The Indian population in each region is divided among districts. There were 47 districts in Canada in 1982. Each of these districts,

or "responsibility centres" as they are now called, contains a number of bands. There were a total of 578 bands in Canada in 1982. Furthermore, one band may occupy more than one reserve.[14]

Population projections for districts and bands were obtained by disaggregating the projected regional populations using the ratio method. This approach was chosen because of the practical difficulties in using a component method in districts and bands with wide variations in population size, some of which are so small that reliable projections cannot be made. It was assumed, for the purposes of the projection, that the 1982 proportions of population of each district and band to the regional population would remain constant at both the district and band level over the projection period.

Obviously, the smaller the population of a region is, the greater the chance of errors in the projection. It is essential to keep this in mind when interpreting the projection results for districts and bands.

Population by District

Table 5.12 shows how the 47 districts are distributed among the eight regions. In 1981, the region of Manitoba had only two districts with a total Indian population of 50,000, while in the Atlantic Region, there were three districts with only 13,000 Indians. There are, also, considerable differences in district size among the regions.[15]

---

14. In 1982, there were 2,252 reserves in Canada.
15. See Detailed Tables in Part II for the projected population of each district.

Table 5.12 Number of Districts in Each Region

Region	Number
Atlantic	3
Quebec	6
Ontario	11
Manitoba	2
Saskatchewan	7
Alberta	7
British Columbia	9
Territories	2
Canada	47

Source: Data from Indian and Northern Affairs Canada, 1982.

The most populated district (the Manitoba Regional Office District) has a population of 42,000 and the least populated (the Atlantic Regional Office District) has only 600 persons. By 1996, Manitoba's largest district may include some 60,000 Indians, i.e. 13% of the whole Indian population of Canada. In the other regions, the average population size of the districts will remain of fairly similar magnitude. In 1996, the number of districts with more than 10,000 individuals will have almost doubled according to the projections, there will be 19 such districts by 1996, against only 10 in 1981.

Population by Band

The 578 Indian bands across the country vary widely in size. A majority of bands (64% in 1981) consist of less than 500 persons. On a national basis, more than half of the Indian population lives in bands numbering less than 1,000. There are eight bands in 1981 with populations of more than 3,000; three of them are in Ontario (Table 5.13). According to the projections, the size of the most populated band, the Six Nations band, over 10,000 in 1981, could increase to about 15,000 in 1996. In Quebec, only one band,

Source: Same as Table 5.1.

Kahnawake, on the outskirts of Montreal had a population over 5,000 in 1981; it could increase to approximately 7,000 by 1996. Among other large bands one, Lac La Ronge, located in Saskatchewan, may total 4,500 by 1996; another, Blood in Alberta, may exceed 8,000.

Band size is expected to increase over the projection period; in 1996, there could be 17 bands with populations of over 3,000, compared with eight only in 1981. The total population living in bands numbering 3,000 individuals or more, will increase from 39,000 in 1981 to 87,000 by 1996.

The average size of bands also varies from region to region. Alberta has and will continue to have the largest average size, 1,000 in 1981; 1,400 by 1996. Quebec ranks second, with averages of 860 in 1981 and 1,100 in 1996. In British Columbia, 54% of the Indian population lived in bands of under 500 in 1981; 39% may do so in 1996.

6. LIMITATIONS OF PROJECTIONS

The accuracy of any projection depends on the reliability of the data on the base population, the time series on births, deaths and migration, and the degree to which the underlying assumptions on each component represent the actual trends. The population size of the geographic area and the length of the projections have also direct bearing on the reliability of the projections. In general, the uncertainty of the projection can be expected to increase with the length of the time horizon and to be greater for smaller populations. The quality of the Indian projections presented is affected by the twin problems of poor quality data and small size of the population.

Since the data taken from the Register were not initially collected for statistical purposes, they are subject to various limitations such as late reporting and underreporting of events, coding and editing errors, misclassifications, etc. Of these, the most serious ones were late reporting and possible underreporting of vital events. The limitations of data on births and deaths due to these factors will have an impact on the time series used for developing the component assumptions and the base population by age and sex. The data were adjusted to remove as much as possible the bias caused by late reporting and underreporting. Even after adjustment, the data showed some anomalies which could not be corrected in the absence of any additional supporting information. There is also an implicit assumption that the level and pattern of late reporting and underreporting of vital events observed in the past will prevail over the projection period which may, or may not, be true.

In addition to births, deaths and migration, the Indian population universe is subject to inflows and outflows due to events such as interethnic marriages, enfranchisements, adoptions and revocations of

status, some of which decrease the population while others add to it. Some idea of the size of this "residual growth" can be obtained by subtracting natural increase (births minus deaths) from total increase, as shown in Table 6.1. The net effect of these events, which fluctuates from year to year, is usually positive, resulting in the addition of several hundred persons (in 1981, almost 600, or 8% of natural increase). These movements could not be taken into account in the adjustment of the base data nor in the developments of the assumptions. Thus, at the national level, only the natural increase was projected to which were added, at the regional level, interregional population movements. To these may be added the possible impact of the impending changes to the Indian Act 1951 on the future size and age-sex structure of the Indian population which is not taken into account.

Table 6.1 Total Growth, Natural Increase and Residual Growth, Registered Indian Population of Canada, 1971 to 1981

(in thousands)

Year	Population	Total Growth	Natural Increase	Residual Growth
1971	263.1	-	-	-
1972	270.8	7.7	7.0	0.7
1973	277.4	6.5	6.6	-0.1

1981	335.5	8.2	7.6	0.6

Source: 1971-1981: Data from the Indian Register (INAC), adjusted for the late reporting of births and deaths.

The application of the projection model and the development of assumptions on each component involved many related parameters and assumptions. These include assumptions on the mean and modal ages of fertility, the total fertility rate, life expectancy, the convergency between Indian fertility and mortality trends and those for total Canadian population, and the linking of the future trends in interregional migration of Indians to the overall Canadian pattern of interprovincial migration. While multiple assumptions were made in the case of fertility and mortality, a single assumption was made for interregional migration. Because of the relatively smaller magnitude of interregional migration flows among Indians, alternative assumptions would have had little effect on the size and structure of the projected populations.

The projections for on-and off-reserve populations and for districts and bands are less reliable than the national and regional projections. They are prepared by a ratio method under the assumption that the ratios of the population of the smaller area to that of the corresponding larger area would remain constant for the projection period. Because of the arbitrary nature of the "constant ratio" assumption and the small population size of the districts and bands, these projections should be used with caution.

The foregoing discussion indicates the various limitations inherent in the projections presented. The impact of these limitations on projections should be kept in mind when interpreting the results.

7. AVAILABILITY OF UNPUBLISHED PROJECTIONS

A total of six projections of the registered Indian population for Canada, INAC regions and provinces by single years of age and sex were produced for each year to 1996. Of these, only three projections, as illustrated in Table 4.1, for Canada and one projection (medium-growth) for INAC regions are presented in this report. Unpublished data for a more detailed age breakdown for Canada, INAC regions and provinces, and the projected population for districts, bands, and on and off reserve, based on alternative scenarios are also available on request.

Inquiries about the unpublished data or adjusted time series on births, deaths and population should be directed to: Research Branch, Indian and Northern Affairs Canada, Ottawa, Ontario K1A 0H4.

PART II. DETAILED TABLES

D.1

ESTIMATED POPULATION OF REGISTERED INDIANS BY AGE, SEX AND PLACE OF RESIDENCE, CANADA AND INAC REGIONS, 1981

(AS OF DECEMBER 31st)

These tables are organized in the following hierarchical order:

- place of residence (on and off reserve, on reserve, off reserve);
- sex (both sexes, male, female).

ESTIMATED POPULATION OF REGISTERED INDIANS BY AGE, SEX AND PLACE OF RESIDENCE, CANADA AND INAC REGIONS, 1981

D.2

PROJECTIONS OF REGISTERED INDIAN POPULATION OF CANADA BY PLACE OF RESIDENCE, SEX AND 5-YEAR AGE GROUPS, DECEMBER 31st, 1982 TO 1996,

(3 SELECTED SERIES)

These tables are organized in the following hierarchical order:

- growth scenario (medium-, slow-, rapid-growth);
- place of residence (on and off reserve, on reserve, off reserve);
- sex (both sexes, male, female).

MEDIUM GROWTH — POPULATION PROJECTIONS OF REGISTERED INDIANS, CANADA AND INAC REGIONS, 1982 - 1996

CANADA — ON & OFF RESERVE — BOTH SEXES
